

Countries carrying the largest share of stroke burden hold the smallest share of the neurological workforce (n = 17 countries)

A ratio above 1.0 means the country holds a larger share of the sample's stroke burden than of its neurologists; below 1.0 the reverse. The axis is logarithmic because the ratio spans three orders of magnitude, which also places parity at the center. Capacity is WHO Global Dementia Observatory neurologist density per 100 000 (2017); burden is WHO Global Health Estimates age-standardized stroke DALYs per 100 000 (2004). Eswatini and Fiji report zero neurologists and cannot be placed on a ratio scale at all; their stroke DALY rates are 1536 and 994 per 100 000.
