

The approved DHS holdings are broad; the WHO capacity data are the limiting factor

Derived from the filenames in the approved DHS Program download manifest. No survey data were downloaded or read: the DHS filename convention CCTTVVFL.zip encodes country, file type and survey phase, which is enough to build a coverage inventory. GE files carry displaced GPS cluster coordinates and are the input for the distance-to-care measure planned as the next step. Panel C is the reason the country-level analysis in Figures 1 to 3 is small: DHS covers 106 countries, but only 19 of them have a WHO neurologist-density value to link them to.
